

Climate Prediction Center's Afghanistan Hazards Outlook For USAID / FEWS-NET April 16 - 22, 2019

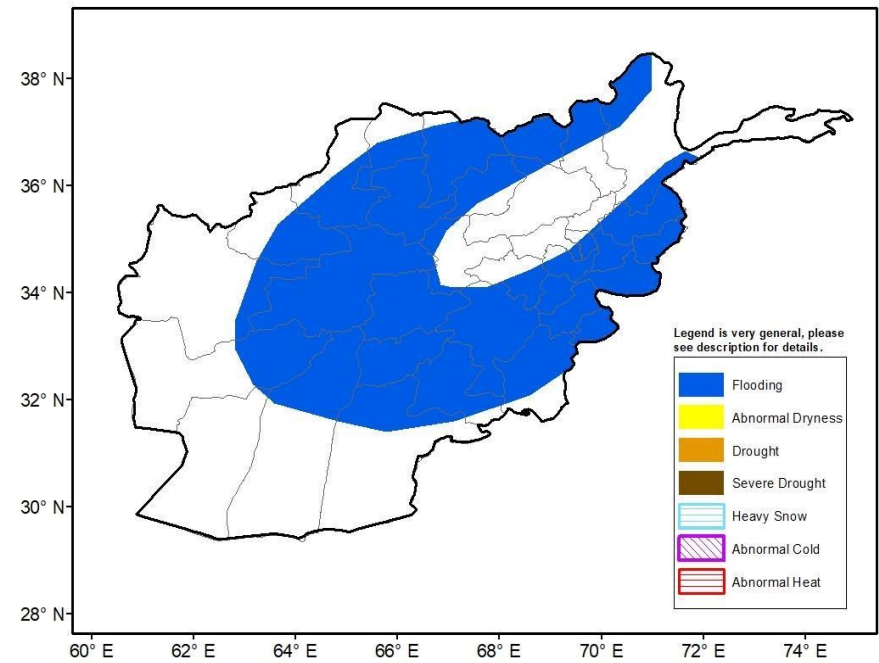

Temperatures:

Below-normal temperatures were observed across Afghanistan during the last week. They were most notable in the north where mean maximum temperatures were 6-8 degrees below normal. Freezing temperatures extended into the lower elevations of northwest Afghanistan. Maximum temperatures still reached 30°C along the country's southern border. Model solutions indicate that below normal temperatures will likely persist due to frequent precipitation. However, minimum temperatures are forecast to remain above freezing at the lower elevations.

Precipitation:

Multiple low-pressure systems during March and early April resulted in frequent rain and high-elevation snow across the country. According to the RFE satellite estimates, more than 100mm of precipitation occurred across northern and western Afghanistan during the past 30 days. The cumulative effect of this precipitation and rapid snow melt caused severe flooding in more than a dozen provinces of Afghanistan.

Periods of rain and high-elevation snow (25-100mm, liquid equivalent) are forecast to continue across Afghanistan into the latter half of April. Due to recent heavy precipitation and saturated soils, additional rainfall along with continued snowmelt will likely worsen ongoing river flooding or trigger flash flooding. A large flooding hazard is necessary due to the predicted widespread heavy precipitation along with uncertainty on exactly where flash flooding may occur.

Climate Prediction Center's Central Asia Hazards Outlook April 16 - 22, 2019

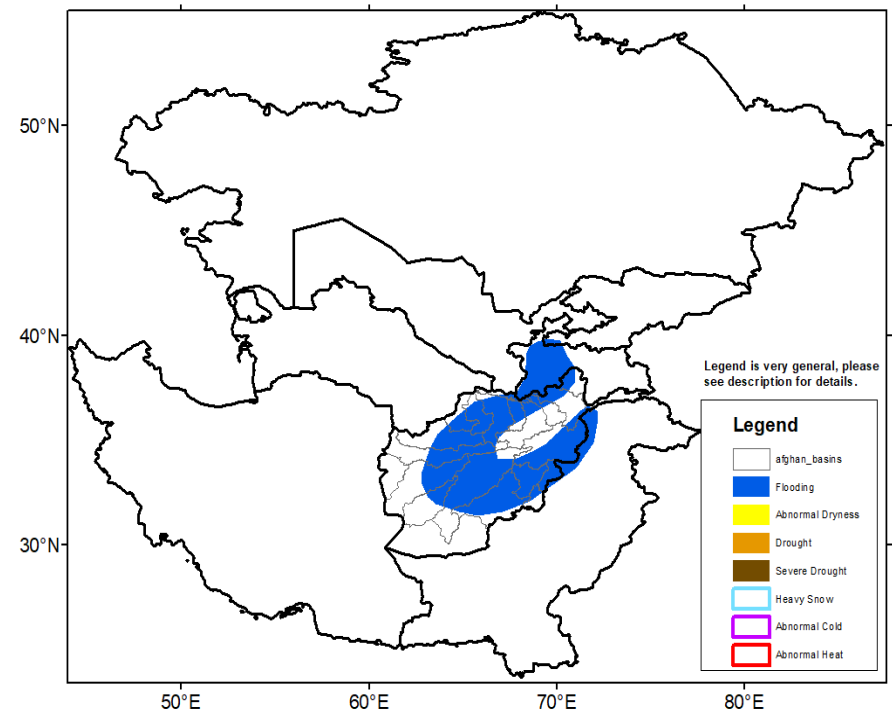

Temperatures:

Below normal temperatures were observed across Afghanistan, Turkmenistan, and Uzbekistan during early April. Freezing temperatures extended as far south as Uzbekistan and the lower elevations of northwest Afghanistan. Above normal temperatures were limited to Kazakhstan from April 5 to 11. Model solutions indicate that below normal temperatures are likely to persist across Afghanistan, Turkmenistan, and Uzbekistan due to frequent precipitation. However, minimum temperatures are forecast to remain above freezing at the lower elevations.

Precipitation

Multiple low-pressure system during March and into early April resulted in frequent rain and high-elevation snow across Afghanistan, Kyrgyzstan, Tajikistan, and southern parts of Turkmenistan and Uzbekistan. According to the RFE satellite estimates, more than 100 mm of precipitation occurred across northern and western Afghanistan during the past 30 days. The cumulative effect of this precipitation and rapid snow melt caused severe flooding in more than a dozen provinces of Afghanistan.

Occasional rain and high-elevation snow (25 to 100 mm, liquid equivalent) are forecast to continue across Afghanistan and Tajikistan into the latter half of April. Due to recent heavy precipitation and saturated soils, additional rainfall along with continued snowmelt are likely to worsen ongoing river flooding or trigger flash flooding. A large flooding hazard is necessary due to the predicted widespread heavy precipitation along with uncertainty on exactly where flash flooding may occur. According to a report from the Food and Agriculture Organization of the United Nations, there are an increasing number of hopper bands across parts of southern Iran and Pakistan.

Note: The Hazards outlook map is based on current weather/climate information, short and medium range weather forecasts (up to 1 week) and assesses their potential impact on crop and pasture conditions. Shaded polygons are added in areas where anomalous conditions have been observed. The boundaries of these polygons are only approximate at this continental scale. This product does not reflect long range seasonal climate forecasts for indicate current or projected food security conditions.

FEWS NET is a USAID-funded activity whose purpose is to provide objective information about food security conditions. Its views are not necessarily reflective of those of USAID or the U.S. Government. The FEWS NET weather hazards outlook process and products include participation by FEWS NET field and home offices, NOAA-CPC, USGS, USDA, NASA, and a number of other national and regional organizations in the countries concerned. Questions or comments about this product may be directed to Wassila.Thiaw@noaa.gov or 1-301-683-3424. Questions about the USAID FEWSNET activity may be directed to Gary Eilerts, USAID Program Manager for FEWSNET, 1-202-254-0204 or geilerts@usaid.gov.
